

My Division Story Problem

By: Theresa

Jane has 24 pieces of candy. She wants to give each of her 4 friends an equal amount of candy. How many pieces of candy will each of her friends need?

$$24 \div 4 = 6$$

How I solved the Problem

First, I moved the candy out of the way. Then, I drew 4 boxes because I knew that I needed 4 groups. Then I moved one piece of candy into each box. Next, I counted the candy in each box and found that there were 6 pieces. So 24 divided by 4= 6.
